## CURVATURE OF HOES

They have 3 angles in relation to the handle for different applications without changing the product's ergonomics.

**C - Straight angle:** makes it easier to dig and hoe the soil deeply, resulting in better turning of the material. Harvesting roots and opening planting holes can be facilitated with the use of this product.

**B - Intermediate angle:** ideal to hoe the soil superficially, open small grooves, and add fertilizer. In construction, it facilitates the preparation of mortar and other mixtures.

**A - Closed angle in relation to the handle:** recommended for scraping the soil, for easier removal of weeds with a superficial root system, scraping residues from construction jobs, and other materials affixed to a surface.
