

## How to prepare your self-watering planters for growing

- ① Pass the strings through the bigger holes in the internal recipients
- ② As a first layer, at the bottom of the planter pot, add small stones (gravel, expanded clay, etc.)
- ③ Cover the layer of stones with a sandy substrate
- ④ Cover the previous layer with fertilized dirt or substrate (the strings should reach the dirt level)
- ⑤ Add seeds or seedlings to the dirt
- ⑥ Open the lid and fill the water recipient to the drain height (for use in outdoor environments, the drain lid should be removed)
